

KINETIC MOLECULAR THEORY

(PAGES 418 – 423)

States of Matter:

1. State the three basic states of matter.
2. What is the fourth state of matter?
3. What does the term "incompressible" mean?
4. Why are solids and liquids incompressible?
5. What is a crystal lattice?
6. What is the difference between vibrational motion, rotational motion and translational motion?
7. How can gases flow in all directions?

Forces Between Particles:

1. In which state are the attractive forces between particles the greatest?
2. Describe how electrostatic attraction explains ionic bonding.
3. Describe how intermolecular forces explain dipole-dipole interactions.
4. Why do most non-polar molecules exist as gases at room temperature?
5. How does the size of the particle affect the state of a substance?

Kinetic Molecular Theory:

1. How does the temperature of the substance affect the state of a substance?
2. What is kinetic energy?
