

pH Sheet

- 1.a) Identify how the final concentration of hydroxide present compares to the concentration of hydronium when a base has been neutralized by an acid.
b) Explain why diluting a base can reduce the pH to 7 but no further.
- 2.a) If the H^+ concentration of a solution is $2.52 \times 10^{-9} \text{ mol/L}$, what is the pH of the solution?
b) If the pH of an acid is 5.2, what was the concentration in mol/L of the original acid?
c) If that same acid was actually triprotic, what would be its original concentration in mol/L?
d) How many more times acidic is a pH of 8 compared to a pH of 13?
- 3.a) Identify **one** way a concentrated acid and a strong acid are similar.
b) Identify **one** way a concentrated acid and a strong acid are different.
c) Explain how a soluble weak acid could have the same pH as a poorly soluble strong acid.
d) Explain how a concentrated weak acid could have the same pH as a dilute strong acid.
